

Use Now, Pay Never

Private, yield-funded autopay for agents

AI agents can pay automatically

But their owners still fund them manually

Without auto-funding, agents
aren't fully autonomous

**Deposit once. Earn yield.
Turn that yield into agent payments
without revealing anything.**

Deposit once. Yield handles every call.

Agent

USDC

Deposit
1,000 USDC

Subly Vault

Earn Yield
(APY 5~10%)

Data API

What your agent buys stays private

Privacy-preserving x402 for agents.
Payment metadata stays inside a TEE.

The seller gets paid.
The buyer's purchase stays private.

What your agent buys stays private

Encrypted Shared Vault

Store vault state encrypted on-chain.
Compute over it with Arcium.

Balances, yield, and accounting state
are never exposed.

We start where it's real: \$290M ARR on x402 today

Our initial users

Solana agent builders who already
HODL idle USDC.

No new behavior required.

Subly turns what they already do
into autopay.

I also like the core message: deposit once, earn yield, and pay privately. If AI agents are expected to act independently, they need a more durable funding model than constantly relying on manual wallet refills. That makes the concept feel useful and relevant.

Combining yield generation with payment infrastructure makes Subly feel more unique than just another payment protocol.

The strongest part of Subly is that it solves a real infrastructure problem for AI agents. A lot of systems talk about autonomous AI but if an agent still depends on a human to monitor and refill its wallet it is not truly autonomous. Subly addresses that problem directly and that makes the concept practical and relevant.

The "deposit once, pay forever" concept is a powerful solution to the friction of manual credits and subscription management.

Also obfuscating the link between agents and service providers is a massive selling point for businesses wanting to protect their operational tech stack and usage data.

What's the Next Step?

Colosseum Frontier Hackathon

1. Develop and launch the MVP on devnet
2. Gain traction and prove the concept
3. Published Subly npm packages
 - a. [subly402-sdk](#)
 - b. [subly402-express](#)

2026 Q2-Q3

1. Develop the alpha version on mainnet
2. Launch the alpha version
3. Complete a security audit

2026 Q4

1. Reach 1,000+ users/agents
2. Launch the public version on mainnet
